

What needs to be put in place to create an invigorated clinical trials environment?

Panel Session 1: Setting the scene

- High quality clinical trials play a crucial role in all areas of medicine by providing useful (reliable, informative, actionable) answers to important clinical questions
- Incentivizing and enabling such trials requires active, concerted effort
 - *Prioritize good trial design*: Unless the design challenge is addressed, all other measures will fail
 - *Adopt and implement principles based clinical trial guidance*: Remove burden for participants and trial staff, promote efficient resource utilization to improve quality
 - *Establish fit-for-purpose infrastructure*: Identify and address system barriers, invest in infrastructure and people
 - *Maintain and improve through useful practice*: Enable embedding of high quality trials in clinical practice for common health problems
